## Statement of the lemma

Recall from the last talk the statement of the key lemma:

### Lemma (the Lifting Lemma)

Let  $(\mathbb{A}, \sigma^{-1})$  and  $(\mathbb{B}, \sigma^{-1})$  be countable substructures of  $(\mathcal{P}(\omega)/\text{Fin}, \sigma^{-1})$  with  $\mathbb{A} \subseteq \mathbb{B}$ , and suppose  $\eta$  is an elementary embedding from  $(\mathbb{A}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$ . Then  $\eta$  extends to an embedding  $\bar{\eta}$  of  $(\mathbb{B}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$ , with  $\bar{\eta} \circ \iota = \eta$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & \overset{\bar{\eta}}{\dashrightarrow} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

## Statement of the lemma

Recall from the last talk the statement of the key lemma:

### Lemma (the Lifting Lemma)

Let  $(\mathbb{A}, \sigma^{-1})$  and  $(\mathbb{B}, \sigma^{-1})$  be countable substructures of  $(\mathcal{P}(\omega)/\text{Fin}, \sigma^{-1})$  with  $\mathbb{A} \subseteq \mathbb{B}$ , and suppose  $\eta$  is an elementary embedding from  $(\mathbb{A}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$ . Then  $\eta$  extends to an embedding  $\bar{\eta}$  of  $(\mathbb{B}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$ , with  $\bar{\eta} \circ \iota = \eta$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & \overset{\bar{\eta}}{\dashrightarrow} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

The goal of this talk is to discuss some of the ideas that go into the proof of this lemma.

## Restatement of the lemma

An instance of the lifting problem is a 4-tuple

$$((\mathbb{A}, \sigma^{-1}), (\mathbb{B}, \sigma^{-1}), \iota, \eta)$$

where  $\mathbb{A}, \mathbb{B}$  are countable subalgebras of  $\mathcal{P}(\omega)/\text{Fin}$  closed wrt  $\sigma, \sigma^{-1}$ , and  $\mathbb{A} \subseteq \mathbb{B}$ , and  $\eta$  is an embedding  $(\mathbb{A}, \sigma^{-1}) \rightarrow (\mathcal{P}(\omega)/\text{Fin}, \sigma)$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

## Restatement of the lemma

An *instance of the lifting problem* is a 4-tuple

$$((\mathbb{A}, \sigma^{-1}), (\mathbb{B}, \sigma^{-1}), \iota, \eta)$$

where  $\mathbb{A}, \mathbb{B}$  are countable subalgebras of  $\mathcal{P}(\omega)/\text{Fin}$  closed wrt  $\sigma, \sigma^{-1}$ , and  $\mathbb{A} \subseteq \mathbb{B}$ , and  $\eta$  is an embedding  $(\mathbb{A}, \sigma^{-1}) \rightarrow (\mathcal{P}(\omega)/\text{Fin}, \sigma)$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & \overset{\bar{\eta}}{\dashrightarrow} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

A *solution* to this instance of the lifting problem is an embedding  $\bar{\eta}$  of  $(\mathbb{B}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$  such that  $\bar{\eta} \circ \iota = \eta$ .

## Restatement of the lemma

An *instance of the lifting problem* is a 4-tuple

$$((\mathbb{A}, \sigma^{-1}), (\mathbb{B}, \sigma^{-1}), \iota, \eta)$$

where  $\mathbb{A}, \mathbb{B}$  are countable subalgebras of  $\mathcal{P}(\omega)/\text{Fin}$  closed wrt  $\sigma, \sigma^{-1}$ , and  $\mathbb{A} \subseteq \mathbb{B}$ , and  $\eta$  is an embedding  $(\mathbb{A}, \sigma^{-1}) \rightarrow (\mathcal{P}(\omega)/\text{Fin}, \sigma)$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & \overset{\bar{\eta}}{\dashrightarrow} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

A *solution* to this instance of the lifting problem is an embedding  $\bar{\eta}$  of  $(\mathbb{B}, \sigma^{-1})$  into  $(\mathcal{P}(\omega)/\text{Fin}, \sigma)$  such that  $\bar{\eta} \circ \iota = \eta$ .

**Lifting Lemma:** An instance  $((\mathbb{A}, \sigma^{-1}), (\mathbb{B}, \sigma^{-1}), \iota, \eta)$  of the lifting problem has a solution if  $\eta$  is an elementary embedding.

## Partitions are represented by digraphs

Suppose  $\mathcal{A}$  is a finite partition of  $\mathcal{P}(\omega)/\text{Fin}$  (dually, a partition of  $\omega^*$  into finitely many clopen sets).

## Partitions are represented by digraphs

Suppose  $\mathcal{A}$  is a finite partition of  $\mathcal{P}(\omega)/\text{Fin}$  (dually, a partition of  $\omega^*$  into finitely many clopen sets). Then the action of  $\sigma$  on  $\mathcal{A}$  can be represented by a digraph  $\langle \mathcal{A}, \overset{\sigma}{\rightarrow} \rangle$ , where

$$a \overset{\sigma}{\rightarrow} b \quad \Leftrightarrow \quad \sigma(a) \wedge b \neq 0.$$

## Partitions are represented by digraphs

Suppose  $\mathcal{A}$  is a finite partition of  $\mathcal{P}(\omega)/\text{Fin}$  (dually, a partition of  $\omega^*$  into finitely many clopen sets). Then the action of  $\sigma$  on  $\mathcal{A}$  can be represented by a digraph  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$ , where

$$a \xrightarrow{\sigma} b \quad \Leftrightarrow \quad \sigma(a) \wedge b \neq 0.$$

$$A = \{n \in \omega : n \text{ ends in a } 0, 3, \text{ or } 5\}$$

$$B = \{n \in \omega : n \text{ ends in a } 1\}$$

$$C = \{n \in \omega : n \text{ ends in a } 6, 7, \text{ or } 8\}$$

$$D = \{n \in \omega : n \text{ ends in a } 2, 4, \text{ or } 9\}$$

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \overset{\mathcal{V}}{\rightarrow} \rangle$  is a *walk* if  $v_i \overset{\mathcal{V}}{\rightarrow} v_{i+1}$  for all  $i < n$ .

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \overset{\mathcal{V}}{\rightarrow} \rangle$  is a *walk* if  $v_i \overset{\mathcal{V}}{\rightarrow} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \overset{\mathcal{V}}{\rightarrow} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \overset{\mathcal{V}}{\rightarrow} \rangle$  from  $v$  to  $v'$ .

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

*A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).*

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

*A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).*

*A sketch of the “if” direction:*

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).

A sketch of the “if” direction:

Suppose  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a strongly connected digraph.

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).

A sketch of the “if” direction:

Find a walk  $\langle v_0, v_1, \dots, v_k \rangle$  with  $v_0 = v_k$  that crosses every edge.

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).

A sketch of the “if” direction:

Find a walk  $\langle v_0, v_1, \dots, v_k \rangle$  with  $v_0 = v_k$  that crosses every edge.

## Specifically, by strongly connected digraphs

A sequence  $\langle v_0, v_1, \dots, v_n \rangle$  of vertices in a digraph  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is a *walk* if  $v_i \xrightarrow{\nu} v_{i+1}$  for all  $i < n$ .  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  is *strongly connected* if for any  $v, v' \in \mathcal{V}$ , there is a walk in  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  from  $v$  to  $v'$ .

### Lemma

A digraph is isomorphic to one of the form  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$  if and only if it is strongly connected (and similarly for  $\sigma^{-1}$ ).

A sketch of the “if” direction:

Let us say an epimorphism  $\phi$  of a digraph  $\langle \mathcal{V}, \rightarrow \rangle$  onto  $\langle \mathcal{A}, \overset{\sigma}{\rightarrow} \rangle$  is *realizable* (as a refinement of  $\mathcal{A}$ ) if there is a refinement  $\mathcal{B}$  of  $\mathcal{A}$  that mimics the epimorphism. Otherwise,  $\phi$  is *unrealizable* with respect to  $\mathcal{A}$ .

## Back to the lemma

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

Given an instance of the lifting problem, the countable structures  $(\mathbb{A}, \sigma^{-1})$  and  $(\mathbb{B}, \sigma^{-1})$  can be approximated by sequences of finite digraphs as on the previous slide.

## Back to the lemma

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

Given an instance of the lifting problem, the countable structures  $(\mathbb{A}, \sigma^{-1})$  and  $(\mathbb{B}, \sigma^{-1})$  can be approximated by sequences of finite digraphs as on the previous slide.

The embedding  $\eta$  translates each finite partition  $\mathcal{A}$  of  $\mathbb{A}$  into a partition  $\tilde{\mathcal{A}}$  of  $\mathcal{P}(\omega)/\text{Fin}$ , and the resulting digraphs are isomorphic:

$$\langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle \cong \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \quad \text{where} \quad \tilde{\mathcal{A}} = \{\eta(a) : a \in \mathcal{A}\}.$$

## Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem).

# Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem). Let  $\mathcal{A}$  be a finite partition of  $\mathbb{A}$ , and consider a partition  $\mathcal{B}$  of  $\mathbb{B}$  refining  $\mathcal{A}$ .

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & \xrightarrow{\bar{\eta}} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array} \qquad \begin{array}{ccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & & \\ \downarrow \text{natural} & & \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\ \text{epimorphism} & \text{induced} & \\ & \text{by } \eta & \end{array}$$

## Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem). Let  $\mathcal{A}$  be a finite partition of  $\mathbb{A}$ , and consider a partition  $\mathcal{B}$  of  $\mathbb{B}$  refining  $\mathcal{A}$ .

$$\begin{array}{ccc}
 (\mathbb{B}, \sigma^{-1}) & \xrightarrow{\bar{\eta}} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\
 \uparrow \iota & \nearrow \eta & \\
 (\mathbb{A}, \sigma^{-1}) & & 
 \end{array}$$

$$\begin{array}{ccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & & \\
 \downarrow \text{natural} & \searrow & \\
 \text{epimorphism} & & \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\
 & \text{induced} & \\
 & \text{by } \eta & 
 \end{array}$$

There is an epimorphism from  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$ .

## Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem). Let  $\mathcal{A}$  be a finite partition of  $\mathbb{A}$ , and consider a partition  $\mathcal{B}$  of  $\mathbb{B}$  refining  $\mathcal{A}$ .

$$\begin{array}{ccc}
 (\mathbb{B}, \sigma^{-1}) & \xrightarrow{\bar{\eta}} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\
 \uparrow \iota & \nearrow \eta & \\
 (\mathbb{A}, \sigma^{-1}) & & 
 \end{array}$$

$$\begin{array}{ccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{B}}, \xrightarrow{\sigma} \rangle \\
 \downarrow \text{natural epimorphism} & \text{induced by } \bar{\eta} & \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\
 & \text{induced by } \eta & 
 \end{array}$$

There is an epimorphism from  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$ . And via  $\bar{\eta}$ , there is a refinement  $\tilde{\mathcal{B}}$  of  $\tilde{\mathcal{A}}$  that mimics this epimorphism.

## Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem). Let  $\mathcal{A}$  be a finite partition of  $\mathbb{A}$ , and consider a partition  $\mathcal{B}$  of  $\mathbb{B}$  refining  $\mathcal{A}$ .

$$\begin{array}{ccc}
 (\mathbb{B}, \sigma^{-1}) & \xrightarrow{\bar{\eta}} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\
 \uparrow \iota & \nearrow \eta & \\
 (\mathbb{A}, \sigma^{-1}) & & 
 \end{array}$$

$$\begin{array}{ccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{B}}, \xrightarrow{\sigma} \rangle \\
 \downarrow \text{natural epimorphism} & \text{induced by } \bar{\eta} & \swarrow \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\
 & \text{induced by } \eta & 
 \end{array}$$

There is an epimorphism from  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$ . And via  $\bar{\eta}$ , there is a refinement  $\tilde{\mathcal{B}}$  of  $\tilde{\mathcal{A}}$  that mimics this epimorphism. In other words, the epimorphism  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$  is realizable.

# Finitary instances of the Lifting Lemma

Suppose we can find  $\bar{\eta}$  (solve the lifting problem). Let  $\mathcal{A}$  be a finite partition of  $\mathbb{A}$ , and consider a partition  $\mathcal{B}$  of  $\mathbb{B}$  refining  $\mathcal{A}$ .

$$\begin{array}{ccc}
 (\mathbb{B}, \sigma^{-1}) & \xrightarrow{\bar{\eta}} & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\
 \uparrow \iota & \nearrow \eta & \\
 (\mathbb{A}, \sigma^{-1}) & & 
 \end{array}$$

$$\begin{array}{ccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{B}}, \xrightarrow{\sigma} \rangle \\
 \downarrow \text{natural epimorphism} & \text{induced by } \bar{\eta} & \downarrow \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\
 & \text{induced by } \eta & 
 \end{array}$$

There is an epimorphism from  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$ . And via  $\bar{\eta}$ , there is a refinement  $\tilde{\mathcal{B}}$  of  $\tilde{\mathcal{A}}$  that mimics this epimorphism. In other words, the epimorphism  $\langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle$  to  $\langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle$  is realizable.

## Lemma

*The converse is also true: If all the epimorphisms arising in this way via  $\iota$  and  $\eta$  are realizable, then  $\bar{\eta}$  exists.*

## Elementarity, my dear Watson

Thus the proof of the Lifting Lemma reduces to:

# Elementarity, my dear Watson

Thus the proof of the Lifting Lemma reduces to:

**Question:** In a “finitary instance” of the lifting problem (right),

$$\begin{array}{ccc} (\mathbb{B}, \sigma^{-1}) & & (\mathcal{P}(\omega)/\text{Fin}, \sigma) \\ \uparrow \iota & \nearrow \eta & \\ (\mathbb{A}, \sigma^{-1}) & & \end{array}$$

$$\begin{array}{ccc} \langle \mathcal{B}, \overset{\sigma^{-1}}{\rightarrow} \rangle & & \\ \downarrow \text{natural epimorphism} & \searrow \phi & \\ \langle \mathcal{A}, \overset{\sigma^{-1}}{\rightarrow} \rangle & \cong & \langle \tilde{\mathcal{A}}, \overset{\sigma}{\rightarrow} \rangle \\ \text{induced by } \eta & & \end{array}$$

# Elementarity, my dear Watson

Thus the proof of the Lifting Lemma reduces to:

**Question:** In a “finitary instance” of the lifting problem (right),

But if  $\eta$  is an elementary embedding, then yes! :)

## Incompatible epimorphisms

Suppose  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ ,  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$ , and  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  are strongly connected digraphs, and  $\phi$  and  $\psi$  are epimorphisms from  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$  and from  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ , respectively.

# Incompatible epimorphisms

Suppose  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ ,  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$ , and  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  are strongly connected digraphs, and  $\phi$  and  $\psi$  are epimorphisms from  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$  and from  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ , respectively. We say that  $\phi$  and  $\psi$  are *compatible* if there is a fourth strongly connected digraph  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  and epimorphisms  $\bar{\phi}$  and  $\bar{\psi}$  from  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  to  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  and from  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  to  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$ , respectively, such that  $\phi \circ \bar{\phi} = \psi \circ \bar{\psi}$ .

## Incompatible epimorphisms

Suppose  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ ,  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$ , and  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  are strongly connected digraphs, and  $\phi$  and  $\psi$  are epimorphisms from  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$  and from  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$  to  $\langle \mathcal{A}, \xrightarrow{\mathcal{A}} \rangle$ , respectively. We say that  $\phi$  and  $\psi$  are *compatible* if there is a fourth strongly connected digraph  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  and epimorphisms  $\bar{\phi}$  and  $\bar{\psi}$  from  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  to  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  and from  $\langle \mathcal{D}, \xrightarrow{\mathcal{D}} \rangle$  to  $\langle \mathcal{C}, \xrightarrow{\mathcal{C}} \rangle$ , respectively, such that  $\phi \circ \bar{\phi} = \psi \circ \bar{\psi}$ .

Otherwise  $\phi$  and  $\psi$  are *incompatible*.

# An example of incompatible epimorphisms

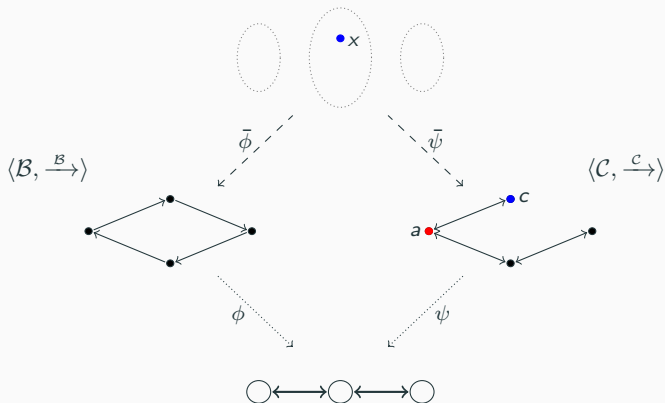

# An example of incompatible epimorphisms

Suppose, aiming for a contradiction, that  $\phi$  and  $\psi$  are compatible.

# An example of incompatible epimorphisms

Suppose, aiming for a contradiction, that  $\phi$  and  $\psi$  are compatible.  
Let  $x \in \bar{\psi}^{-1}(c)$ .

# An example of incompatible epimorphisms

Suppose, aiming for a contradiction, that  $\phi$  and  $\psi$  are compatible. Let  $x \in \bar{\psi}^{-1}(c)$ . There are some  $v, w \in \bar{\psi}^{-1}(a)$  with  $v \rightarrow x \rightarrow w$ .

# An example of incompatible epimorphisms

Suppose, aiming for a contradiction, that  $\phi$  and  $\psi$  are compatible. Let  $x \in \bar{\psi}^{-1}(c)$ . There are some  $v, w \in \bar{\psi}^{-1}(a)$  with  $v \rightarrow x \rightarrow w$ . Because  $\bar{\phi}(v) = \bar{\phi}(w) = b$ , we should have  $b \rightarrow \bar{\phi}(x) \rightarrow b$ .

# An example of incompatible epimorphisms

Suppose, aiming for a contradiction, that  $\phi$  and  $\psi$  are compatible. Let  $x \in \bar{\psi}^{-1}(c)$ . There are some  $v, w \in \bar{\psi}^{-1}(a)$  with  $v \rightarrow x \rightarrow w$ . Because  $\bar{\phi}(v) = \bar{\phi}(w) = b$ , we should have  $b \rightarrow \bar{\phi}(x) \rightarrow b$ . But  $\langle \mathcal{B}, \xrightarrow{\mathcal{B}} \rangle$  contains no such vertex.

The relevant epimorphisms are always compatible.

# The relevant epimorphisms are always compatible.

## Lemma

*Given a partition  $\mathcal{A}$  of  $\mathbb{A}$  and its image  $\tilde{\mathcal{A}}$  in  $\mathcal{P}(\omega)/\text{Fin}$ , any two epimorphisms arising naturally in the Lifting Lemma (any two finitary instances of the lifting problem) are compatible.*

# The relevant epimorphisms are always compatible.

## Lemma

*Given a partition  $\mathcal{A}$  of  $\mathbb{A}$  and its image  $\tilde{\mathcal{A}}$  in  $\mathcal{P}(\omega)/\text{Fin}$ , any two epimorphisms arising naturally in the Lifting Lemma (any two finitary instances of the lifting problem) are compatible.*

*Proof:* Let  $\mathcal{D}$  be a common refinement of  $\mathcal{B}$  and  $\mathcal{C}$ , and let  $\bar{\phi}$  and  $\bar{\psi}$  be the natural maps from  $\mathcal{D}$  onto  $\mathcal{B}$  and  $\mathcal{C}$ , respectively.  $\square$

# The relevant epimorphisms are always compatible.

## Lemma

*Given a partition  $\mathcal{A}$  of  $\mathbb{A}$  and its image  $\tilde{\mathcal{A}}$  in  $\mathcal{P}(\omega)/\text{Fin}$ , any two epimorphisms arising naturally in the Lifting Lemma (any two finitary instances of the lifting problem) are compatible.*

*Proof:* Let  $\mathcal{D}$  be a common refinement of  $\mathcal{B}$  and  $\mathcal{C}$ , and let  $\bar{\phi}$  and  $\bar{\psi}$  be the natural maps from  $\mathcal{D}$  onto  $\mathcal{B}$  and  $\mathcal{C}$ , respectively.  $\square$

In other words, the epimorphisms that we actually encounter in the lifting problem are always compatible with one another.

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & & \\ \text{natural} & \searrow \phi & \\ \text{map} & & \\ \downarrow & & \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\ & \text{induced} & \\ & \text{by } \eta & \end{array}$$

## The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & & \\ \text{natural} & \searrow \phi & \\ \text{map} & & \\ \downarrow & & \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\ & \text{induced} & \\ & \text{by } \eta & \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & & \\ \text{natural map} \downarrow & \searrow \phi & \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\ & \text{induced by } \eta & \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

Aiming for a contradiction, suppose  $\phi$  is not realizable.

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \xrightarrow{\text{red } \times} & \langle \tilde{\mathcal{C}}, \xrightarrow{\sigma} \rangle \\ \text{natural map} \downarrow & \searrow \phi & \text{natural map} \downarrow \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & \cong & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle \\ & \text{induced by } \eta & \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

Aiming for a contradiction, suppose  $\phi$  is not realizable. By the Dichotomy Theorem, there is a refinement  $\tilde{\mathcal{C}}$  of  $\tilde{\mathcal{A}}$  incompatible with  $\phi$ .

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \xrightarrow{\text{red } \times} & \langle \tilde{\mathcal{C}}, \xrightarrow{\sigma} \rangle & \cong & \langle \mathcal{C}, \xrightarrow{\sigma^{-1}} \rangle \\
 \text{natural map} \downarrow & \searrow \phi & \text{natural map} \downarrow & \text{induced by } \eta & \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle & \cong & \\
 & & \text{induced by } \eta & & 
 \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

Aiming for a contradiction, suppose  $\phi$  is not realizable. By the Dichotomy Theorem, there is a refinement  $\tilde{\mathcal{C}}$  of  $\tilde{\mathcal{A}}$  incompatible with  $\phi$ . But  $\eta$  is elementary! Thus, because  $\tilde{\mathcal{C}}$  refines  $\tilde{\mathcal{A}} = \eta[\mathcal{A}]$  in  $\mathcal{P}(\omega)/\text{Fin}$ ,  $\mathcal{A}$  must have an identical-looking refinement  $\mathcal{C}$  in  $\mathbb{A}$ .

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccccc} \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \text{---} \times \text{---} & \langle \tilde{\mathcal{C}}, \xrightarrow{\sigma} \rangle & \cong & \langle \mathcal{C}, \xrightarrow{\sigma^{-1}} \rangle \\ \text{natural} & & \text{natural} & \text{induced} & \\ \text{map} & & \text{map} & \text{by } \eta & \\ \downarrow & \searrow \phi & \downarrow & & \\ \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle & \cong & \\ & & \text{induced} & & \\ & & \text{by } \eta & & \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

Aiming for a contradiction, suppose  $\phi$  is not realizable. By the Dichotomy Theorem, there is a refinement  $\tilde{\mathcal{C}}$  of  $\tilde{\mathcal{A}}$  incompatible with  $\phi$ . But  $\eta$  is elementary! Thus, because  $\tilde{\mathcal{C}}$  refines  $\tilde{\mathcal{A}} = \eta[\mathcal{A}]$  in  $\mathcal{P}(\omega)/\text{Fin}$ ,  $\mathcal{A}$  must have an identical-looking refinement  $\mathcal{C}$  in  $\mathbb{A}$ . Then  $\mathcal{B}$  and  $\mathcal{C}$  are two incompatible refinements of  $\mathcal{A}$ .

# The role of elementarity

Consider some finitary instance of the lifting problem.

$$\begin{array}{ccccc}
 \langle \mathcal{B}, \xrightarrow{\sigma^{-1}} \rangle & \xrightarrow{\text{red } \times} & \langle \tilde{\mathcal{C}}, \xrightarrow{\sigma} \rangle & \cong & \langle \mathcal{C}, \xrightarrow{\sigma^{-1}} \rangle \\
 \text{natural map} \downarrow & \searrow \phi & \text{natural map} \downarrow & \text{induced by } \eta & \\
 \langle \mathcal{A}, \xrightarrow{\sigma^{-1}} \rangle & & \langle \tilde{\mathcal{A}}, \xrightarrow{\sigma} \rangle & \cong & \\
 & & \text{induced by } \eta & & 
 \end{array}$$

The Lifting Lemma holds if and only if all such epimorphisms are realizable (i.e., option 1 from the Dichotomy Theorem holds).

Aiming for a contradiction, suppose  $\phi$  is not realizable. By the Dichotomy Theorem, there is a refinement  $\tilde{\mathcal{C}}$  of  $\tilde{\mathcal{A}}$  incompatible with  $\phi$ . But  $\eta$  is elementary! Thus, because  $\tilde{\mathcal{C}}$  refines  $\tilde{\mathcal{A}} = \eta[\mathcal{A}]$  in  $\mathcal{P}(\omega)/\text{Fin}$ ,  $\mathcal{A}$  must have an identical-looking refinement  $\mathcal{C}$  in  $\mathbb{A}$ .

Then  $\mathcal{B}$  and  $\mathcal{C}$  are two incompatible refinements of  $\mathcal{A}$ . Impossible!

## But how do you prove the Dichotomy Theorem?

To get some idea of the proof of the Dichotomy Theorem, fix a partition  $\mathcal{A}$  of  $\mathcal{P}(\omega)/\text{Fin}$

## But how do you prove the Dichotomy Theorem?

To get some idea of the proof of the Dichotomy Theorem, fix a partition  $\mathcal{A}$  of  $\mathcal{P}(\omega)/\text{Fin}$ , and let  $\phi$  be an epimorphism from a strongly connected digraph  $\langle \mathcal{V}, \overset{\nu}{\rightarrow} \rangle$  to  $\langle \mathcal{A}, \overset{\sigma}{\rightarrow} \rangle$ .

## But how do you prove the Dichotomy Theorem?

Suppose alternative 1 fails: i.e., there is no refinement  $\mathcal{B}$  of  $\mathcal{A}$  in  $\mathcal{P}(\omega)/\text{Fin}$  such that the natural map  $\mathcal{B} \rightarrow \mathcal{A}$  mimics  $\phi$ .

## But how do you prove the Dichotomy Theorem?

The partition  $\mathcal{A}$  is not recoverable from the isomorphism class of its digraph  $\langle \mathcal{A}, \sigma \rangle$ .

## But how do you prove the Dichotomy Theorem?

The partition  $\mathcal{A}$  is not recoverable from the isomorphism class of its digraph  $\langle \mathcal{A}, \sigma \rightarrow \rangle$ . But it can be recovered from  $\langle \mathcal{A}, \sigma \rightarrow \rangle$  plus a specific infinite walk through  $\langle \mathcal{A}, \sigma \rightarrow \rangle$ .

## But how do you prove the Dichotomy Theorem?

The failure of alternative 1 means that there is no infinite walk through  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$  that follows our walk through  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$ , or even that follows it with finitely many errors.

## But how do you prove the Dichotomy Theorem?

In other words, if we imagine someone walking through  $\langle \mathcal{V}, \xrightarrow{\nu} \rangle$ , trying to follow our specific walk in  $\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$ , then they get “lost” after finitely many steps, regardless of when they started following.

## But how do you prove the Dichotomy Theorem?

## But how do you prove the Dichotomy Theorem?

Using this, we must find a partition  $\mathcal{C}$  of  $\mathcal{A}$  such that the natural map from  $\langle \mathcal{C}, \sigma \rangle$  to  $\langle \mathcal{A}, \sigma \rangle$  is incompatible with  $\phi$ .

## But how do you prove the Dichotomy Theorem?

The rough idea is that the finite digraph  $\langle \mathcal{C}, \overset{\sigma}{\rightarrow} \rangle$  must encode all the different ways in which a walker in  $\langle \mathcal{V}, \overset{\nu}{\rightarrow} \rangle$  can get lost.

# But how do you prove the Dichotomy Theorem?

An important piece of  $\mathcal{C}$  is the *state space digraph* arising from  $\phi$ .

$\langle \mathcal{A}, \xrightarrow{\sigma} \rangle$

$\phi, \langle \mathcal{V}, \xrightarrow{\nu} \rangle$

$\langle \mathcal{S}\phi, \xrightarrow{\mathcal{S}\phi} \rangle$

## But how do you prove the Dichotomy Theorem?

An important piece of  $\mathcal{C}$  is the *state space digraph* arising from  $\phi$ .

$\langle \mathcal{A}, \sigma \rangle$

$\phi, \langle \mathcal{V}, \nu \rangle$

$\langle \mathcal{S}\phi, \mathcal{S}\phi \rangle$

Roughly, this digraph keeps track not of the individual vertices in a walk through  $\langle \mathcal{V}, \nu \rangle$ , but the set of possible vertices where a “follower” might be at a given time.

## But how do you prove the Dichotomy Theorem?

An important piece of  $\mathcal{C}$  is the *state space digraph* arising from  $\phi$ .

$$\langle \mathcal{A}, \overset{\sigma}{\rightarrow} \rangle$$

$$\phi, \langle \mathcal{V}, \overset{\nu}{\rightarrow} \rangle$$

$$\langle \mathcal{S}^\phi, \overset{\sigma^\phi}{\rightarrow} \rangle$$

Roughly, this digraph keeps track not of the individual vertices in a walk through  $\langle \mathcal{V}, \overset{\nu}{\rightarrow} \rangle$ , but the set of possible vertices where a “follower” might be at a given time. The digraph  $\langle \mathcal{C}, \overset{\sigma}{\rightarrow} \rangle$  combines this state space with an isomorphic copy of  $\langle \mathcal{A}, \overset{\sigma}{\rightarrow} \rangle$ .

Thank you for listening!
